## 1.4 EUT Exercise Software

The testing software is provided by the applicant.

The testing software is designed to exercise the EUT in a manner similar to a typical use. It will make EUT continuously to transmit the signal to the monitor. The testing program will force PC continuously to output the testing pattern.

## 1.5 Test Performed

Conducted emissions were investigated over the frequency range from 0.15MHz to 30MHz using a receiver which bandwidth is set at 9KHz.

Radiated emissions were investigated over the frequency range from 30MHz to 1000MHz using a receiver which bandwidth is set at 120KHz. Radiated measurement was performed at distance that from an antenna to EUT is 10 meters.

The testing result of pretest was shown out that the "Transmitting/Receiving" mode is worse than the "Standby" mode. So, the final measurement was made on the "Transmitting/Receiving" mode.

There are three video resolution testing modes when the tests and the measurements were performed: "640 x 480", "800 x 600", "1024 x 768".

The testing result of pretest was shown out that the "Video resolution: 1024 x 768" mode is worse than other two video resolution testing mode. So, the final measurement was made on the "Video resolution: 1024 x 768".

The peripheral devices are also connected to the main power through a LISN that provides a 50 ohm / 50  $\mu$ H coupling impedance with 50 ohm termination. (Please refers to the block diagram of the test setup and photograph.)

Both sides of DC line are checked for the maximum conducted emission interference. In order to find the maximum emissions, the relating positions of equipment and all of the interference cables must be changed according to EN 55011/1999 regulation: The measurement procedure on conducted emission interference.

The resolution bandwidth of the field strength meter ( Rohde & Schwarz ) is set at 9KHz.
