MIC-3463

6U 5-slot backplane with CT bus and rear I/O for *CompactPCI™*

Product warranty

Advantech warrants to you, the original purchaser, that each of its products will be free from defects in materials and workmanship for one year from the date of purchase.

This warranty does not apply to any products which have been repaired or altered by persons other than repair personnel authorized by Advantech, or which have been subject to misuse, abuse, accident or improper installation. Advantech assumes no liability under the terms of this warranty as a consequence of such events.

Because of Advantech's high quality-control standards and rigorous testing, most of our customers never need to use our repair service. If an Advantech product is defective, it will be repaired or replaced at no charge during the warranty period. For out-of-warranty repairs, you will be billed according to the cost of replacement materials, service time and freight. Please consult your dealer for more details.

If you think you have a defective product, follow these steps:

1. Collect all the information about the problem encountered. (For example, CPU speed, Advantech products used, other hardware and software used, etc.) Note anything abnormal and list any on-screen messages you get when the problem occurs.

2. Call your dealer and describe the problem. Please have your manual, product, and any helpful information readily available.

3. If your product is diagnosed as defective, obtain an RMA (return merchandize authorization) number from your dealer. This allows us to process your return more quickly.

4. Carefully pack the defective product, a fully-completed Repair and Replacement Order Card and a photocopy proof of purchase date (such as your sales receipt) in a shippable container. A product returned without proof of the purchase date is not eligible for warranty service.

5. Write the RMA number visibly on the outside of the package and ship it prepaid to your dealer.

Packing List

Before installation, ensure that the following materials have been received:

* The MIC-3463 backplane

* This user's manual

If any of these items are missing or damaged, contact your distributor or sales representative immediately.

Technical Support and Sales Assistance

If you have any technical questions about the MIC-3463 or any other Advantech products, please visit our support website at:

Introduction

1.1 General Information

The MIC-3463 is a 6U-sized CT backplane that provides five Compact-PCI slots. One slot is assigned to the CPU board and four slots to the peripheral boards. The MIC-3463 supports front and rear I/O wiring, providing simplified system cabling. The backplane also complies with PICMG 2.5 Computer Telephony Specification, providing H.110 CT bus on the P4 connectors.

The MIC-3463 provides a 6-pin connector for connecting up to 4 cooling fans. A 20-pin connector can be used for connecting an external alarm module (MIC-3920/MIC-3921) to detect the system internal conditions, such as bus voltages, fan speed, and temperatures.

In order to provide users with a flexible system configuration, the MIC-3463 includes two standard ATX power connectors to accpet up to two ATX power supplies.

The MIC-3463 complies with PICMG 2.1 Hot-Swap Specification, providing full hot-swapping capability. Users can build a hot-swap system using hot-swap plug-in boards and software.

1.2 Features

- Front and rear I/O supports
- H.110 CT bus compliant (PICMG 2.5)
- Five 32-bit CompactPCI slots (64-bit upon request)
- Complies with PICMG 2.1 Hot-Swap Specification
- Accepts up to two ATX power supplies
- Alarm module interface
- Fan interface

1.3 Specification

- Five CompactPCI slots (one system slot and four peripheral slots)

- Front and rear I/O supports

- Bus width: 32-bit (64-bit upon request)

- 8-layer PCB, 3.0 mm thick

- Separate power and ground planes

- Power connectors: Two ATX power connectors for connecting standard ATX power supplies

- 20-pin connector for MIC-3920/MIC-3921 alarm board signals

- Complies with CompactPCI Specification PICMG 2.0, Ver.2.1

- Complies with CompactPCI Hot Swap Specification PICMG 2.1, Ver.1.0

- Complies with Computer Telephony Specification PICMG 2.5, Ver.1.0

- V I/O Voltage: 3.3 V or 5 V, jumper selectable

- Logic Ground and Chassis Ground can be isolated or common

- Dimensions: 122 x 262.2 mm

- Operating temperature: -40 ~ 80°C (-40 ~ 176°F)

CHAPTER **2**

Hardware Configuration

2.1 Slot Assignments

The CompactPCI specification defines slot numbering seperating for physical and logical slots. Each slot has a physical number and a logical number (refer to the CompactPCI specification version 2.0 R2.1 for further information on slot assignments). The physical numbers are printed on the backplane, enclosed in circles or triangles, below each slot. Slot 5, marked by a triangle, is the system slot and can only be used by a CPU board. The other slots (slot 1~4) are peripheral slots and can be used by peripheral cards.

The logical number of each slot is defined according to the IDSEL signal and the associated address used to select the slot. Table 2-1 shows the system slot and peripheral slot relationships on the MIC-3463. Physical slot 5 (system slot) has a logical number of 1, physical slot 4 has a logical number of 2, physical slot 3 has a logical number of 3, ..., and physical slot 1 has a logical number of 5. The connectors in logical slot 1 are designated as 1-P1, 1-P2, 1-P3, 1-P4, and 1-P5, from the bottom up. Nomenclature for connectors in other slots is similar, such as 2-P1, 2-P2, 3-P1, 3-P2, etc.

Connector P1 on the system slot (slot 5) is a keyed connector providing 32-bit CompactPCI bus between the system slot and the peripheral slots 1~4. Connector P2 on the system slot (slot 5) is an un-keyed connector providing 64-bit CompactPCI bus between the system slot and the peripheral slots 1~4. Connector P4 on the peripheral slots 1~4 are un-keyed connectors which provide H.110 CT bus used for TDM signals transmission.

Appendix A gives the pin assignment for all the slots on the MIC-3463.
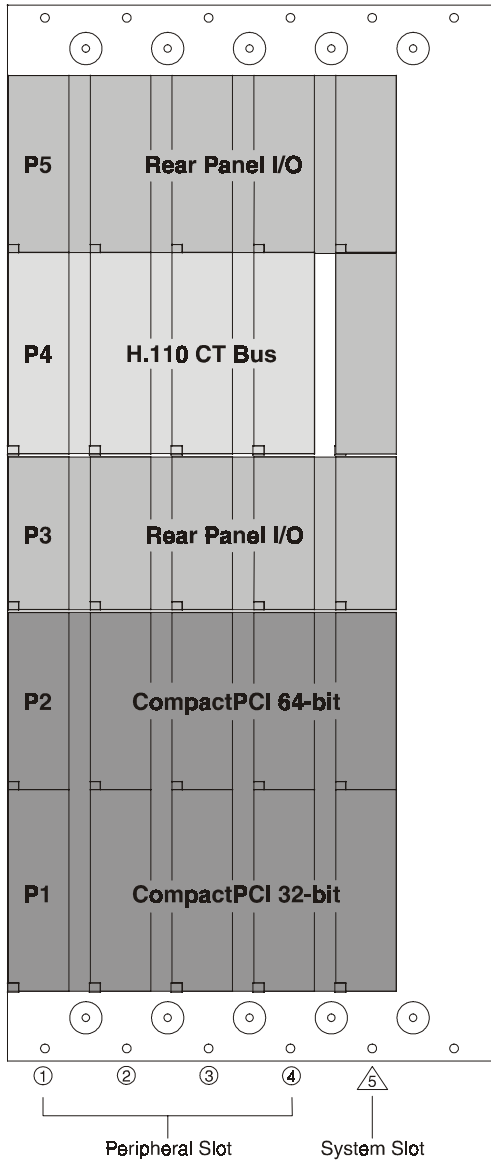

Figure 2-1: Slot numbering of the MIC-3463

Table 2-1: System to peripheral slot signal assignment

Signal	Connector: Pin	Signal	Connector: Pin
System Slot 5, (Logical Slot 1):		Peripheral Slot 4, (Logical slot 2)

GNT3#	P2:C3	GNT#	P1:E5

2.2 Connector and Jumper Locations

The MIC-3463 provides connectors and jumpers for users to configure the backplane for specific application. Table 2-2 gives a brief description to each connector on the backplane. Figure 2-2 and Figure 2-3 illustrate the connector locations of the MIC-3463.

Table 2-2: MIC-3463 Connector and jumper description

Name	Function
JP1	V I/O voltage selection jumper
JP2	Power switch connector
ATX1	ATX power connector 1
ATX2	ATX power connector 2
CN1	Peripheral power connector 1
CN2	Peripheral power connector 2
CN3	Fan module connector
CN4	Power supply status connector
CN5	Alarm board interface connector
M1 ~ M10	Screw terminal for external power supply
Figure 2-2: The connector and jumper locations on the front side
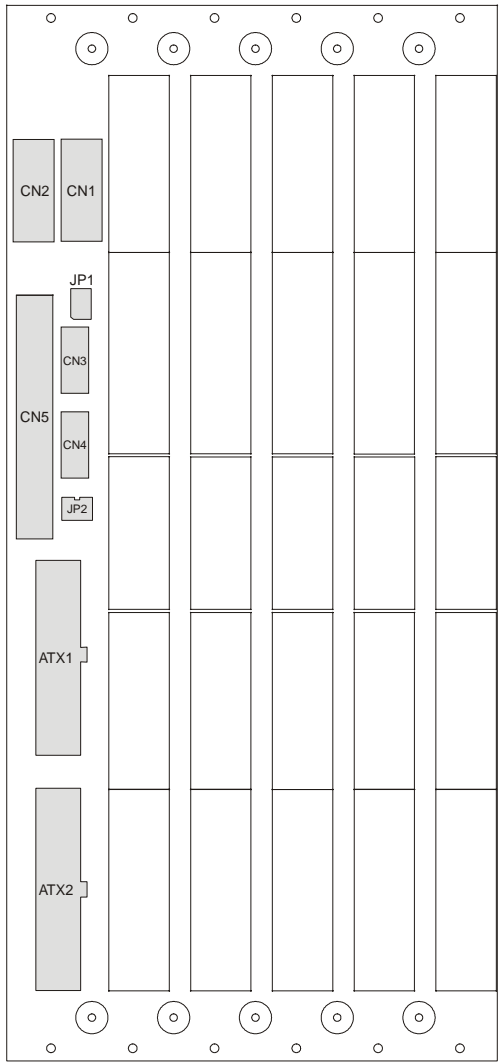

Figure 2-3: The connector and jumper locations on the rear side

2.2.1 Alarm Board Interface (CN5)

The 20-pin connector CN5 is an interface for an external monitoring and alarm module, such as MIC-3920/MIC-3921, which monitors the conditions of the system. It contains bus voltages 3.3 V, 5 V, 12 V and -12 V, and utilizes four fan tachometer signals.

2.2.2 Fan Module Connector (CN3)

The CN3 connector provides +12 V power for fan operation and accepts the tachometer output from the fans. It accepts up to four fan signals.

2.2.3 ATX Power Connector (ATX1 and ATX2)

These connectors accept two standard ATX power supplies.

Note: Do not use ATX power supplies and plug-in power modules at the same time.
2.2.4 Power Connectors for Peripherals (CN1 and CN2)

The CN1 and CN2 connectors provide power to the peripherals, such as hard disk drives or floppy disk drives.

2.2.5 V I/O Voltage Selection (JP1)

This jumper is used to select the V I/O voltage. MIC-3463 allows V I/O to be set to either 5 V or 3.3 V. Since the MIC-3463 default is configured for use with 5 V CompactPCI boards (blue keyed connectors), once the jumper is set to 3.3 V, the CompactPCI keys must be changed to 3.3 V at the same time (as yellow keyed connectors).

Table 2-3: V I/O voltage selection

V I/O	JP1
3.3 V	+3.3V / VIO / +5V
5 V	+3.3V / VIO / +5V

2.2.6 Power Switch (JP2)

This connector provides power on/off control of the ATX power supply or the plug-in power module. If the CompactPCI chassis provides a 2-pin power switch cord, connect this cord to the JP2 connector and users can control the power on/off by the power switch. Or users can directly short this connector by a jumper and control the power on/off by the ATX power supply switch.

2.2.7 Power Supply Status Connector (CN4)

This connector provides voltage feedbacks for the power supply used. Three voltages can be sensed: +3.3 V, +5 V, and +12 V, and then the feedback to the power supply will stabilize the power supply output. A power good singal can be detected and transfered to the alarm module (MIC-3920/MIC-3921) for power supply status monitoring. This connector can function well only if the power supply provides the same function and pin assignment as the CN4 connector.

2.2.8 Screw terminal for external power supply

Along the upper and lower edges of the MIC-3463 are 10 power pads providing external power supply I/O. These 10 pads facilitate input or output of the different powers and grounds. Contact Advantech for installation help.

2.3 Ground Configuration

Along the top and bottom of the MIC-3463 are 12 mounting holes. The holes are arranged in an alternating pattern of chassis (frame) grounded pads and logic grounded pads. The square pad holes are connected to chassis ground, and the round pad holes are connected to logic ground. To isolate chassis and logic grounds, install mounting screws in only square pad mounting holes.
Figure 2-4. Mounting Holes Illustration

2.4 Computer Telephony Bus

The MIC-3463 provides H.110 CT bus on the P4 connectors, which complies with the PICMG 2.5 Computer Telephony Specification. The CT bus is routed across the P4 connectors on the peripheral slots. Please refer to Appendix A for pin assignment information.

2.5 Clock Routing Configuration

The MIC-3463 is configured to comply with the clock routing specified in the CompactPCI Hot Swap Specification, PICMG 2.1, version 1.0. This Specification requires that each slot be independently clocked.

If users would like to reconfigure the backplane to comply with the earlier CompactPCI Specification, PICMG 2.0, version 2.1, which allows the MIC-3463 to be backward compatible with CPUs using shared clocks, please contact Advantech for help.
