Abstract	IAG_FAQ_ADAM-6700_Node-red application tutorial & Example		
Keyword	Node-RED, Modbus TCP, ADAM-6700, Azure, MQTT, SQL		
Related Product	ADAM-6700 series		

■ Problem Description:

Node-RED is a visual tool for wiring the Internet of Things. It's built on Node.js and support browser-based flow editing. User can download different Node-RED library to develop their own IoT application.

This document will introduce and categorize different Node-RED application with explanations and provide the sample flow for user reference.

■ Application of Node-RED

Application	Node-Red Sample flow
Data Upload via different protocol	✓ Update data via Modbus ✓ Update data via MQTT
Data upload to different platform	✓ Update data to Azure ✓ Update data to SQL database ✓ Update data to Remote FTP server
I/O extension and application	✓ AI Alarm trigger DO ✓ Extend IO with ADAM-4000/6000 series
Data processing	✓ Analyze the data , scaling, calculation ✓ Data visualization by dashboard
Others	✓ Modbus TCP server ✓ Data logger function

1 Data Upload via different protocol

1.1 Update data via Modbus

Node-red flow example:

Used nodes & Steps

- Step 1: Drag above node and connect them to a flow
 - ADAM read Node: Select the module you are going to read Modbus data, Enter Module's IP, polling rate, and reconnect interval in this node
 - Debug Node: For printing the message.

A screenshot of the 'Edit ADAM-read node' configuration window. The window has a title bar 'Edit ADAM-read node' and buttons for 'Delete', 'Cancel', and 'Done'. Under the 'node properties' section, there are several fields:

- Name**: A text input field with the placeholder 'Name'.
- Series**: Two radio buttons, 'Modbus TCP' (selected) and 'Modbus RTU'.
- Device Type**: A dropdown menu showing 'ADAM-6266'.
- Host**: A text input field with '10.1.1.36'.
- Poll Rate (ms)**: A text input field with '2000'.
- Reconnect Interval (s)**: A text input field with '3'.

 A red rectangular box highlights the 'Device Type', 'Host', 'Poll Rate', and 'Reconnect Interval' fields. Below this section, there is a section titled 'The number of channels to read' with two checked checkboxes: 'DI Value (4-ch)' and 'DO Value (4-ch)'.

- Step 2: See the result on debug column or node status
 - Node status: If connected to ADAM successfully, it will show connected also print the I/O status of each channel
 - Debug column: It will print the message of your debug node

Sample flow

```
[{"id":"5573d4e0.33673c","type":"ADAM-
read","z":"2f8162d5.a284fe","name":"","rate":2000,"host":"10.0.0.60","serialPortCfg":"","unit_id"

```

1.2 Update data via MQTT

Node-red flow example:

Used nodes & Steps

Step 1: Drag below node and connect them to a flow

- MQTT Node: Getting data from MQTT Broker
- Debug Node: For printing the message.

node properties

Server:

Topic:

QoS:

Name:

Broker address and corresponding port number

Subscribe I/O Topic

Quality of Service

Step 2: See the result on debug column or node status

- Node status: If connected to broker successfully, it will show connected
- Debug column: It will print the message of your debug node

The image shows the Node-RED interface. On the left, a flow is visible with an MQTT node (Advantech/00D0C9FAC3EA/data) connected to a msg.payload node. On the right, the debug console is open, showing two log entries. The first entry is a JSON object with various fields including 's', 't', 'q', 'c', 'di1', 'di2', 'di3', 'di4', 'do1', 'do2', 'do3', and 'do4'. The second entry is a string '111'.

Sample flow

```

2 Data upload to different platform

2.1 Update data to Azure

Node-red flow example:

Used nodes & Steps:

Inject Node: Enter “Hello Advantech”

Azure Node: Enter the connection string of your “IoT device” created on Azure.

Edit azureiothub node

Delete Cancel Done

node properties

Name: Azure IoT Hub

Protocol: http

Connection String: HostName=ADAM-series.azure-devices.net;DeviceId=device123

You can find the device connection string as below picture on Azure

resources, services, and docs

Sherry.Lee@Advantec.Sher

ADV EMBEDDED IOT

Sample flow

```
[{"id":"64652724.c72748","type":"azureiothub","z":"c36940f4.544f","name":"Azure IoT Hub","protocol":"http","x":1000,"y":140,"wires":[["2239a513.ee473a"]]},{"id":"2239a513.ee473a","type":"debug","z":"c36940f4.544f","name":"","active":true,"console":"false","complete":"false","x":1230,"y":140,"wires":[]},{"id":"844dd784.9e9f48","type":"inject","z":"c36940f4.544f","name":"","topic":"","payload":"Sherry","payloadType":"str","repeat":"","crontab":"","once":false,"x":810,"y":140,"wires":[["64652724.c72748"]]}]
```

2.2 Update data to SQL database

Node-red flow example:

Used nodes & Steps:

- Drag above node and connect them to a flow
 - Inject Node: Enter SQL command
 - MSSQL Node: Refer to below settings
 - Debug Node: For printing the message.

Edit inject node

node properties

1 **Select String**

Payload: INSERT INTO [Dev].[dbo].[MQTTData] (Topic, Payload) VALUES ('Name', 'Teddylan')

2 **Name**: INSERT INTO

MSSQL -> Edit MSSQL-CN node

Update to complete setting

1 **Node Name (Optional)**: Dev

2 **Database location**: 192.168.1.101
 Local DB: localhost
 Remote DB: IP Address

3 **Username for login DB**: Sherry6700

4 **Password for login DB**:

5 **Database Name**: Dev

6 **Update**

debug

2019/3/27 上午11:14:08 node: aaa69b13.30a6f8
 msg.payload: undefined

2019/3/27 上午11:14:27 node: aaa69b13.30a6f8
 msg.payload: array[1]
 array[1]
 0: object
 Topic: "Name"
 Payload: "Teddylan"

1. After inject message to MSSQL, it should show this message.

2. After inject SELECT node, it should show the message you just inject.

Sample flow

```

[{"id":"e7774694.0c3a18","type":"inject","z":"760d96cd.7330e8","name":"To_AEtest_select","topic":"","payload":"SELECT TOP (3) [Topic],[Payload] FROM [AEtest].[dbo].[MQTTdata]","payloadType":"str","repeat":"","crontab":"","once":false,"x":160,"y":60,"wires":[["b8f1916f.26163"]]}, {"id":"a4a52abe.bb4438","type":"debug","z":"760d96cd.7330e8","name":"","active":true,"console":"false","complete":"false","x":570,"y":40,"wires":[]}, {"id":"ab3b3fd2.27a93","type":"i
  
```

```

2.3 Update data to Remote FTP server

Node-red flow example:

This flow will help to get I/O data from ADAM-6717, and then store into a csv file with column name “channel0” in ADAM-6717 local side. Then we use a timestamp node to trigger the ftp node send the local file from ADAM-6717 to remote FTP server. Since time I/O data will keep updating to the local csv file inside ADAM-6717, so we use the exec node to delete the original file for a certain period. This flow is just a concept, User can change to the node-red flow logic based on their application need. Please note that user have to install the 3rd party [FTP node](https://flows.nodered.org/node/node-red-contrib-ftp) into ADAM-6717 <https://flows.nodered.org/node/node-red-contrib-ftp>

Used nodes & Steps

Step 1: Drag below node and connect them to a flow

- ADAM Node: Get remote I/O data from ADAM-6217, please make sure you enter the correct IP of ADAM module
- Function Node: Convert AI value to string
- CSV Node: Converts between a CSV formatted string and its JavaScript object representation, user can also define the column name in the CSV file.
- FTP Node: For send file to FTP server, please enter the IP of FTP server.
- File Node: For create a file on ADAM-6717 Local directory
- Exec Node: Runs a system command and returns its output, this is used for delete the local file inside ADAM-6717.
- Delay Node: For delay time setting.

Step 2: Check each node setting

- CSV Node: Enter the “Column name” of AI raw data, choose “comma” for the separator.

- **File Node:** Enter the filename, file type and directory you wish to create in ADAM-6717

- **Exec Node:** Enter the remove file linux command after certain delay time

- **FTP Node:** Enter the IP of FTP server

Edit ftp in node

```

3 I/O extension and application

3.1 AI Alarm trigger DO

Node-red flow example:

Used nodes & Steps:

- **Step 1:** Make sure “**read ADAM node**” is connected to ADAM-6017 (IP =10.1.1.16)
- **Step 2:** Use function node “**function**” to write script and print the **node status** to show AI raw data
- **Step 3:** Use function node “**range**” to convert Modbus raw data into engineering data
- **Step 4:** Use function node “**function**” to **Set Global AI value** also Fixed decimal place for better present
- **Step 5:** Use function node “**function**” to **Get Global AI value** as the condition for controlling DO
- **Step 6:** Use “**ADAM write node**” to control DO channel of ADAM-6266 (IP=10.1.1.19)

Sample flow

```
[{"id":"14b33a72.3548e6","type":"ADAM-read","z":"21056b5e.9abb64","name":"","rate":2000,"host":"10.1.1.16","serialPortCfg":"","unit_id":1,"readDI":true,"readDO":true,"readAI":true,"readAO":true,"reconnecttimeout":"","mboutputStyle":"Multiple Outputs","Series":"mbtcp","advDevTypeTCP":"ADAM-6017","advDevTypeRTU":"ADAM-4015","advDevType":"ADAM-6017","x":120,"y":320,"wires":[[],[],["b2f073fb.77df1"],[],[],[],[],[],[],[]],{"id":"ec3151da.4a6d6","type":"function","z":"21056b5e.9abb64","name":"Set Global AI value","func":"var AI0 = msg.payload;\nglobal.set(\"AI0\",AI0);  // this is now available to other nodes\nmsg.payload = AI0.toFixed(3);\nnode.status({fill:\"blue\",shape:\"ring\",text:\"Global AI0 :\"+AI0.toFixed(3)});\n\nreturn msg;","outputs":1,"noerr":0,"x":490,"y":240,"wires":[["863db8fd.f92098","1a7e3f4e.487231","e489efe1.acd6d"]],{"id":"863db8fd.f92098","type":"function","z":"21056b5e.9abb64","name":"Get Global AI value control DO","func":"    var DO0 = 0;\n\n    var ai0 = global.get(\"AI0\");\n\n    // ai0\n    if (ai0 > 2){\n        DO0 = 1;\n    }\n\n    node.status({fill:\"blue\",shape:\"ring\",text:\" DO0:\"+DO0});\n\n\n//node.status({fill:\"blue\",shape:\"ring\",text:\"Global AI0 :\"+AI0.toFixed(3)});\n    var result =
```

```

3.2 Extend IO with ADAM-4000/6000 series

Node-red flow example:

Used nodes & Steps:

- Step 1: Drag above node and connect them to a flow
 - ADAM read Node: Select the module you are going to read Modbus data, Enter Module's IP, polling rate, and reconnect interval in this node
 - Range Node: For Modbus raw data mapping to real data output range. In other words, this node can be also used to scale the raw data.

Edit range node

Delete
Cancel
Done

▼ node properties

Action
Scale msg.payload

Map the input range:
from: 0 to: 65535

to the result range:
from: 0 to: 100

☒ Round result to the nearest integer?

Name
raw data mapping

Tip: This node ONLY works with numbers.

- Debug Node: For printing the message.

- Step 2: See the result on debug column or node status
 - Node status: If connected to ADAM successfully, it will show connected also print the I/O status of each channel
 - Debug column: It will print the message of your debug node

Sample flow

4 Data processing

4.1 Analyze the data , scaling, calculation

Node-red flow example:

Used nodes & Steps:

- **Step1:** Make sure “**read ADAM mode**” is connected to ADAM-6017 (IP =10.1.1.16)
- **Step2:** Use function node “**range**” to convert Modbus raw data into engineering data
- **Step3:** Use function node “**function**” to write script and print the **node status** to show the mapping result
- **Step4:** Use function node “**function**” to Fixed decimal place for better present
- **Step5:** Use output node “**Debug**” for printing the message.

Sample flow

```

4.2 Data visualization by dashboard

Node-red flow example:

Used nodes & Steps:

Step 1: Drag the dashboard node to display specific value of a node-red node, each dashboard node is represent a dashboard widget

Step 2: Edit Group, tab name and bind this name to your widget

Enter <http://localhost:1880/ui> on browser to launch the screen with 2 in total of the dashboard node

chart > **Edit dashboard group node**

Delete Cancel Update

Name Hands-on 2-2

Tab Leapcamp

Width 6

☒ Display group name

chart > dashboard group > **Edit dashboard tab node**

Delete Cancel Update

Name Leapcamp

Icon dashboard

5 Others

5.1 Modbus TCP server

Node-red flow example:

Create Modbus TCP server

Get Local DIO data and write to Modbus TCP server

Used nodes & Steps:

Step1: Use Modbus-Server node to create a space for Modbus TCP server.

For example, user can create the Modbus address for certain amount. In this example, we create below address.

Output 1: holding Buffer, type, msg

Output 2: coils Buffer, type, msg

Output 3: input Buffer, type, msg

Edit Modbus-Server node

Delete
Cancel
Done

node properties

Name
Modbus Server for ADAM-6700

Port
502

Response Delay
100
millisecond(s)

Coils
20

Holding
20

Input
20

Log active
☒

Step2: After you create Modbus address range, you can write data to the Modbus address you just create

You can use the Modbus write nodes (FC) to write data to the server buffers.
You can use the Modbus read nodes (FC) to read data from the server buffers.

Edit Modbus-Write node

```

5.2 Data logger function

Node-red flow example:

Used nodes & Steps:

- Inject Node: Enter String “Hello Europe”
- File Node: Refer to below settings

Delete
Cancel
Done

node properties

Filename

Action

append to file

☒ Add newline (\n) to each payload?

☐ Create directory if it doesn't exist?

Name

Tip: The filename should be an absolute path, otherwise it will be relative to the working directory of the Node-RED process.

Test Result

See the file create in /home/root/sherry in ADAM-6700, and the content is as below

```

10.1.1.27 - PuTTY
1562547916360
1562547917395
1567395732924
1567395765628
Hello Europe
~
~
~
~
~
  
```

- Debug Node: See the result that write to the file
- Tail Node: Refer to below settings

The image shows two screenshots from a flow editor interface. The top screenshot is the 'Edit tail node' dialog, which has buttons for 'Delete', 'Cancel', and 'Done'. Under 'node properties', there are fields for 'Filename' (set to '/home/root/sherry'), 'File type' (set to 'Text - returns String'), a checkbox for 'Split lines on \n?' (unchecked), and a 'Name' field (set to 'Name'). The bottom screenshot shows the 'debug' console with three log entries. Each entry shows a timestamp, node ID, and the path '/home/root/sherry : msg.payload : string[13]'. The first and third entries show the payload 'Hello Europe', while the second entry shows a long alphanumeric string.

Sample flow
